

How to Optimally Cut An Onion: A Love Letter to the Jacobian

For each section in the paper, we provide Mathematica code that verifies the solutions presented.

Inspiration for the Solution

Jacobian for the $h=0$ case

```
In[ ]:= x[r_, θ_] := r Cos[θ];  
y[r_, θ_] := r Sin[θ];  
J[r_, θ_] := Abs[D[x[r, θ], r] × D[y[r, θ], θ] - D[x[r, θ], θ] × D[y[r, θ], r]]  
  
In[ ]:= FullSimplify[Abs[J[r, θ]]]  
Out[ ]:=  
Abs[r]
```

Onion cutting statistics in the $h=0$ case

```
In[ ]:= Abar = Assuming[R > 0,  
Integrate[J[r, θ], {r, 0, R}, {θ, 0, Pi / 2}] / Integrate[1, {r, 0, R}, {θ, 0, Pi / 2}]]  
Out[ ]:=  
 $\frac{R}{2}$ 
```

```
In[ ]:= σ2 = Assuming[R > 0, Integrate[(J[r, θ] - Abar) ^2, {r, 0, R}, {θ, 0, Pi / 2}] /  
Integrate[1, {r, 0, R}, {θ, 0, Pi / 2}]]

A Strange Coordinate System

c_h , x_h , y_h , and J_h from the paper:

```
In[*]:= ch[r_,  $\theta$ _, h_] := h Cos[ $\theta$ ] + Sqrt[r^2 - h^2 Sin[ $\theta$ ]^2];  

xh[r_,  $\theta$ _, h_] := ch[r,  $\theta$ , h] Sin[ $\theta$ ];  

yh[r_,  $\theta$ _, h_] := ch[r,  $\theta$ , h] Cos[ $\theta$ ] - h;  

Jh[r_,  $\theta$ _, h_] :=  

D[xh[r,  $\theta$ , h], r]  $\times$  D[yh[r,  $\theta$ , h],  $\theta$ ] - D[xh[r,  $\theta$ , h],  $\theta$ ]  $\times$  D[yh[r,  $\theta$ , h], r]
```

```
In[*]:= cm[r_,  $\theta$ _, h_] := h Cos[ $\theta$ ] - Sqrt[r^2 - h^2 Sin[ $\theta$ ]^2];
```

Note that the absolute value of the Jacobian is the below expression with the absolute value removed, since $r > h \tan(\theta)$ and $\tan(\theta) > \sin(\theta)$ on this interval. Moreover, $r > 0, h > 0$ and $\cos(\theta) > 0$.

```
In[*]:= FullSimplify[Jh[r,  $\theta$ , h]]
```

```
Out[*]=
```

$$r \left(-1 - \frac{h \cos[\theta]}{\sqrt{r^2 - h^2 \sin[\theta]^2}} \right)$$

So, let's redefine J_h to be positive:

```
In[*]:= Jh[r_,  $\theta$ _, h_] := r + \frac{h r \cos[\theta]}{\sqrt{r^2 - h^2 \sin[\theta]^2}}
```

Calculating Statistics

This code is for the numerator of $\text{Abar}(h)$ in the paper.

This code does not evaluate for me, which is why I claim the integral cannot be done in Mathematica.

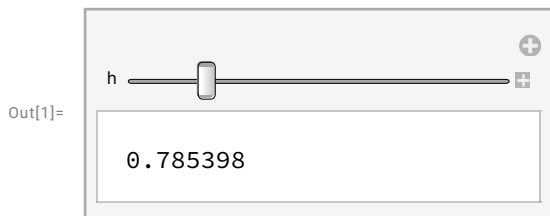

```
In[ ]:= Assuming[0 < h < 1,
  Integrate[r +  $\frac{h r \cos[\theta]}{\sqrt{r^2 - h^2 \sin[\theta]^2}}$ , {θ, 0, ArcTan[1 / h]}, {r, h Tan[θ], 1}]]
```

Out[]=

\$Aborted

The integral can be calculated numerically for any h, however.

```
In[1]:= Manipulate[
  NIntegrate[r +  $\frac{h r \cos[\theta]}{\sqrt{r^2 - h^2 \sin[\theta]^2}}$ , {θ, 0, ArcTan[1 / h]}, {r, h Tan[θ], 1}], {h, .01, 1}]
```

Which compares well to $\pi/4$...

```
In[2]:= N[Pi / 4]
```

Out[2]= 0.785398

The next two calculations are for the denominator of Abar(h) in the paper. We do the inner integral, then the outer.

```
In[ ]:= Integrate[1, {r, h Tan[θ], 1}]
```

Out[]=

1 - h Tan[θ]

```
In[ ]:= Assuming[h > 0, Integrate[1 - h Tan[θ], {θ, 0, ArcTan[1 / h]}]]
```

Out[]=

$\text{ArcTan}\left[\frac{1}{h}\right] - \frac{1}{2} h \text{Log}\left[1 + \frac{1}{h^2}\right]$

This allows us to define Abar(h)

```
In[ ]:= Abarh[h_] = Pi / (4 (ArcTan[ $\frac{1}{h}$ ] -  $\frac{1}{2} h \text{Log}\left[1 + \frac{1}{h^2}\right]$ ))
```

Out[]=

$$\frac{\pi}{4 \left(\text{ArcTan}\left[\frac{1}{h}\right] - \frac{1}{2} h \text{Log}\left[1 + \frac{1}{h^2}\right] \right)}$$

This next code calculates the integrand of f(h) in the paper, when we change coordinates from the onion coordinate system to rectangular coordinates

```
In[*]:= Clear[x, y]
```

```
In[*]:= Assuming[x > 0 && y > 0 && h > 0, FullSimplify[Jh[Sqrt[x^2 + y^2], ArcTan[x / (y + h)], h]]]
```

```
Out[*]=
```

$$\frac{\sqrt{x^2 + y^2} (x^2 + (h + y)^2)}{x^2 + y (h + y)}$$

```
In[*]:= integrand[x_, y_, h_] := \frac{\sqrt{x^2 + y^2} (x^2 + (h + y)^2)}{x^2 + y (h + y)}
```

```
In[*]:= Assuming[s > 0, FullSimplify[integrand[s Cos[φ], s Sin[φ], h]]]
```

```
Out[*]=
```

$$\frac{h^2 + s^2 + 2 h s \sin[\phi]}{s + h \sin[\phi]}$$

Finally, we calculate $f(h)$ by performing the double integral in polar coordinates from the paper

```
In[*]:= Assuming[0 < h < 1, \left( \int_0^1 \int_0^{\pi/2} \left( \frac{h^2 + s^2 + 2 h s \sin[\phi]}{s + h \sin[\phi]} \right) s \, d\phi \, ds \right)]
```

```
Out[*]=
```

$$\frac{1}{6} \left(h + 2\pi + 4(1 - h^2)^{3/2} \operatorname{ArcSin}[h] - 4(1 - h^2)^{3/2} \operatorname{ArcTan}\left[\frac{1 + h}{\sqrt{1 - h^2}}\right] + h^3 \operatorname{Log}[4 h^2] \right)$$

so, we can define $f(h)$

```
In[*]:= f[h_] = \frac{1}{6} \left( h + 2\pi + 4(1 - h^2)^{3/2} \operatorname{ArcSin}[h] - 4(1 - h^2)^{3/2} \operatorname{ArcTan}\left[\frac{1 + h}{\sqrt{1 - h^2}}\right] + h^3 \operatorname{Log}[4 h^2] \right);
```

So, by the formula for $\sigma^2(h)$ in the paper,

```
In[*]:= \sigma^2h[h_] = f[h] / \left( \operatorname{ArcTan}\left[\frac{1}{h}\right] - \frac{1}{2} h \operatorname{Log}\left[1 + \frac{1}{h^2}\right] \right) - Abarh[h]^2
```

```
Out[*]=
```

$$\frac{\pi^2}{16 \left(\operatorname{ArcTan}\left[\frac{1}{h}\right] - \frac{1}{2} h \operatorname{Log}\left[1 + \frac{1}{h^2}\right] \right)^2} + \frac{h + 2\pi + 4(1 - h^2)^{3/2} \operatorname{ArcSin}[h] - 4(1 - h^2)^{3/2} \operatorname{ArcTan}\left[\frac{1 + h}{\sqrt{1 - h^2}}\right] + h^3 \operatorname{Log}[4 h^2]}{6 \left(\operatorname{ArcTan}\left[\frac{1}{h}\right] - \frac{1}{2} h \operatorname{Log}\left[1 + \frac{1}{h^2}\right] \right)}$$

And, making different assumptions, we can calculate the limit as $h \rightarrow \infty$:

```
In[*]:= Assuming[h > 1, \left( \int_0^1 \int_0^{\pi/2} \left( \frac{h^2 + s^2 + 2 h s \sin[\phi]}{s + h \sin[\phi]} \right) s \, d\phi \, ds \right)]
```

```
Out[*]=
```

$$\frac{1}{6} \left(h + 2\pi + 2 h^3 \operatorname{Log}[2 h] - 2 \sqrt{-1 + h^2} \left((1 + 2 h^2) \operatorname{Log}\left[h - \sqrt{-1 + h^2}\right] + 3 h^2 \operatorname{Log}\left[h + \sqrt{-1 + h^2}\right] \right) \right)$$

$$\text{In}[*]:= \text{f[h_]} = \frac{1}{6} \left(h + 2 \pi + 2 h^3 \text{Log}[2 h] - 2 \sqrt{-1 + h^2} \left((1 + 2 h^2) \text{Log}\left[h - \sqrt{-1 + h^2}\right] + 3 h^2 \text{Log}\left[h + \sqrt{-1 + h^2}\right] \right) \right);$$

$$\text{In}[*]:= \sigma 2h[h_]= \text{f[h]} / \left(\text{ArcTan}\left[\frac{1}{h}\right] - \frac{1}{2} h \text{Log}\left[1 + \frac{1}{h^2}\right] \right) - \text{Abarh[h]}^2$$

Out[*]=

$$-\frac{\pi^2}{16 \left(\text{ArcTan}\left[\frac{1}{h}\right] - \frac{1}{2} h \text{Log}\left[1 + \frac{1}{h^2}\right] \right)^2} + \frac{h + 2 \pi + 2 h^3 \text{Log}[2 h] - 2 \sqrt{-1 + h^2} \left((1 + 2 h^2) \text{Log}\left[h - \sqrt{-1 + h^2}\right] + 3 h^2 \text{Log}\left[h + \sqrt{-1 + h^2}\right] \right)}{6 \left(\text{ArcTan}\left[\frac{1}{h}\right] - \frac{1}{2} h \text{Log}\left[1 + \frac{1}{h^2}\right] \right)}$$

$$\text{In}[*]:= \text{Limit}[\sigma 2h[h], h \rightarrow \text{Infinity}]$$

We need to adjust the total volume of the onion by removing a spherical cap

```
sphericalCap[c_] = Pi (1 - c) ^2 (3 - (1 - c)) / 3
```

```
VbarCutoff[h_] := ((2 / 3 Pi - sphericalCap[cutoff]) / 4) / denom3DCutoff[h]
```

Out[*]=

$$\frac{1}{3} (1 - c)^2 (2 + c) \pi$$

This is slow to run...
